Title: Random-walk level noise breaks anytime-valid trend monitoring: A failure theorem, a universal e-process and the price of robustness

Author: Quang-Vinh Dang
British University Vietnam, Hung Yen, Vietnam
ORCID: 0000-0002-3877-8024
Corresponding author: Quang-Vinh Dang, `vinh.dq4@buv.edu.vn`

Keywords: anytime-valid inference; e-process; change detection; random-walk noise; survey time series

Word count: about 7,000 (main text, excluding references and appendix).

Acknowledgments: None.

Disclosure statement: The author reports there are no competing interests to declare.

Funding: The author received no financial support for the research, authorship or publication of this article.

Declaration of generative AI use: Generative AI tools were used to support the writing of code and to polish the language of the manuscript. The research idea, the methods and algorithms, and the interpretation of the results are the author's own. The author reviewed and edited all AI-assisted output and takes full responsibility for the content of the work.

Data availability statement: All data are public statistics of the U.S. Census Bureau. The analysis data set, the code that reproduces every number, table and figure, and a Lean 4 formalization of the martingale and Ville-inequality steps of the validity proof accompany the submission.

CRediT: Quang-Vinh Dang: conceptualization, methodology, formal analysis, software, data curation, visualization, writing (original draft, review and editing).

Ethics: No human participants were involved; only published aggregate statistics were analyzed.
